

THE FOOD QUEST

252 lumps of the requisite size. These are rapidly singed in a fire of dry leaves and so acquire a brown glazed surface, a sort of tough skin which preserves the interior against moisture. The work is now finished. The glazed lump of sago is neatly bound with sago leaves, packed into the hollow of a sago branch, and carried home. Under favourable conditions two or three men will easily make 100 lb. in a day.

Collecting

222 The Orokaiva is a collector only by necessity or opportunity. When a prolonged drought in the South-East season causes a scarcity of food, collecting assumes importance, and a reduced diet must be eked out with roots, leaves, and fern fronds. While it is only under such stress that he collects systematically, he nevertheless keeps his eye open at all times for chance blessings when he is working or travelling. For tearing down betel pepper (*bingi*) or the somewhat rare fruits of the bush he will tie a pair of poles together and bind on a small oblique peg at the end to make a hook. This crude improvisation called *kainpo* may have a reach of 30 feet. The native is, moreover, a nimble and daring climber. If, however, neither his *kainpo* nor his climbing are equal to the occasion, he will fell a large tree for the sake of a little honey or even a nest of edible insects.

[412]
[262] Frogs, snails, and fresh-water bivalves are collected by the humbler hands of women, but not in any quantity; they amount to nothing more than savouries.

Domesticated Animals

231 *The Pig.* The village pig and the wild pig are of the same species, the latter being continually domesticated. When a wild sucking-pig is captured by hunters, it is brought to the village and gradually tamed. Its roving and lawless nature may be restrained by the constant companionship of a long stick tied to its hind leg; it is fed and petted, its ears are snipped, it is castrated, and finally becomes as nearly domesticated as any other native pig. It is accustomed to forage about the village and to roam the neighbouring bush,

ENVIRONMENT AND THE FOOD QUEST 115

western part of the Division, it cannot be said that sago is anywhere scarce. The mode of preparation is simple and expeditious: it consists in kneading and watering the pith which has been scraped from the trunk, in allowing the sago to be carried off in suspension, and in leaving it to settle in a trough. The apparatus is prepared almost wholly from parts of the sago palm itself, and, except for the scraper and a strainer or sieve of coco-nut fibre, may be extemporized on the spot. The finished product is known as 'wet' sago, being a solid block of which the surface is hardened and glazed by scorching. The natives do not find it necessary to dry the product for their own use, and probably know nothing of the process. In the inland districts where the trees are sometimes individually owned sago is highly prized, and young palms, I am told, may be transplanted. In the large swamps the system is one of clan ownership, and as far as I know there is no sort of culture of the palms. 262 252

As a collector the Orokaiva is again an opportunist. Only in time of scarcity, it would appear, does he or his wife go out expressly to gather fern fronds and leaves—the pidgin English 'cabbage'; but wherever he goes he keeps his eye open for food—honey (for which he will fell a tree and smoke out the bees), clusters of somewhat insipid wild figs, nuts, snails, even a nest of flying ants. 423 245

He has certain trees, however, which afford a regular supply of food, viz. bread-fruit in several varieties, the *Tanga* nut, and the cycad *Puga*. The bush does not abound in fruit: of the numerous representatives of the genus *Ficus* only a few are edible, none very tempting, and the wild mango is comparatively rare. (There are some poisonous fruits and plants, chief among them the creeper called 'New Guinea Dynamite', used by the natives for fishing and suicides.) But they have definite opinions as to what may be eaten and what must be left alone, being presumably brought up to this knowledge. (I have seen a little child scolded for mouthing a leaf of 'New Guinea Dynamite' growing in the village.) Although 137 262
